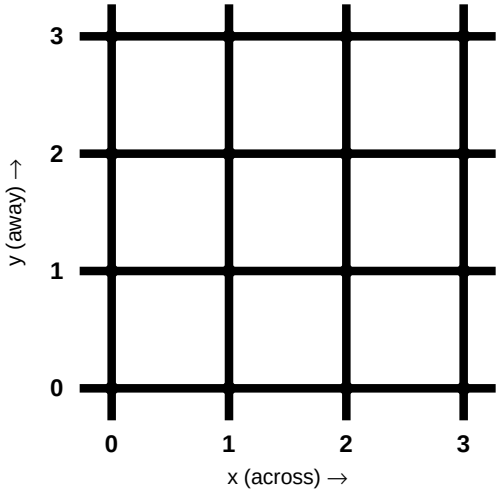
Lesson 4-4 · Make your answer key

Name: _____ Date: _____

Your two tests make six calls to compute_path(). Work out by hand what each one should print, before you write any more code. Across first, then up or down; the start is never in the path. When you run your tests, this sheet is your answer key: every line on screen should match it.



Tips

- Trace each path on the grid with a pencil, then erase it before the next one.
- Each move changes x or y by 1.
- All the moves across (x) come first, then the moves up or down (y).
- Steps = |end x - start x| + |end y - start y|. Use it to check each list's length.
- Path 1 is the trace you already did.

#	Call	Expected path	Steps	Program matched?
`test_paper_paths()`				
1	`compute_path((0, 0), (2, 3))`			Y / N
2	`compute_path((0, 1), (3, 3))`			Y / N
3	`compute_path((3, 3), (1, 0))`			Y / N
`test_edge_cases()`				
4	`compute_path((2, 0), (2, 3))`			Y / N
5	`compute_path((0, 2), (3, 2))`			Y / N
6	`compute_path((1, 1), (1, 1))`			Y / N

Fill in Expected path and Steps now. Circle Y or N after you run your tests.

Question

What is different about path 3 compared with paths 1 and 2?

(Look at which way x and y change.)
